Insightfully Scanned Glucose Monitoring (iSGM)

Novel Modality in Diabetes Monitoring

NFC

FARIR TEB
FARIR ASA TEB

Time to reshape glucose monitoring

Traditional SMBG is Obsolete

Data reporting is unreliable and inaccurate
70% to 90% of BGM data points reported by patients are inaccurate and unreliable. [1,2]

Hypoglycemia episodes are missed
50% of hypoglycemia episodes are not reported in manual logging.[3]

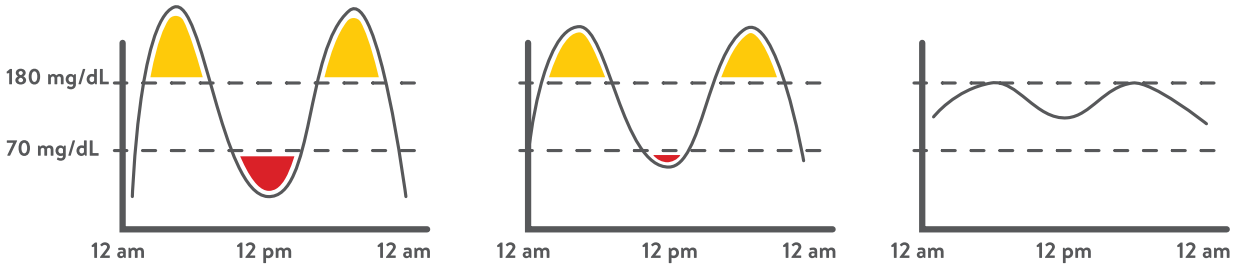
Numerical glucose results provide defective information
Making sense of tons of numbers and dates is a mathematicians job, and its not easy to find necessary information by simply looking at logbooks.

The Fallacy of HbA1c

A Proven tool to assess overall glucose management

A Poor tool to assess glucose variability and complications risk

Relying on HbA1c alone to make therapeutic decisions, has a serious pitfall: missing out glucose variability. [4]



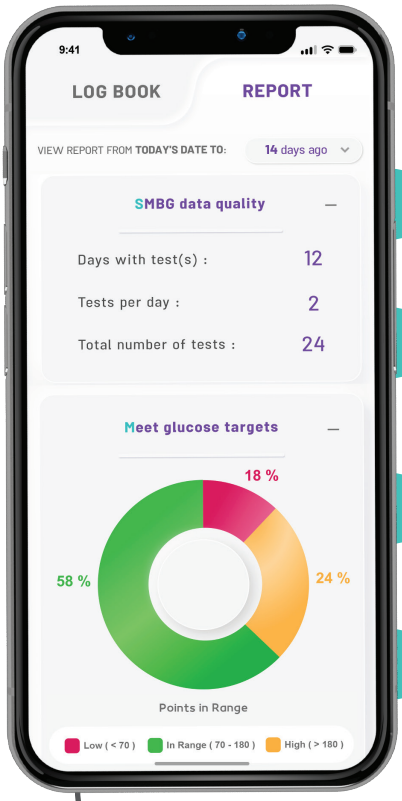
Same HbA1c, different variabilities, different complications risks [4]

Insightfully Scanned Glucose Monitoring (iSGM) Novel Modality in Diabetes Monitoring

Seamless transfer of results in seconds with a simple scan
Accurate and reliable data reporting
Advanced analysis and insightful reports

Safe therapeutic decision making

Insight beyond the numerical glucose results



FREESENS®

SMART View

SMBG Data Quality:
Insights on patients glucose monitoring behavior

Point in Range:
Insights on point in range as the glycemic variability index [5-10]

Modal View:
Identify trends that may otherwise go unnoticed or be hard to find

Risk Analysis:
Insights on patients hypoglycemia episodes

One-step approach to insightful glucose monitoring

FREESENS SMART View Report; path to insightful, targeted and accurate therapeutic adjustments

Experience iSGM with a Demo device!

To receive your demo, please contact us at
021-24837000 (ext. 302) | 8 AM to 4 PM
or ask your designated Farir Asa Teb representative.
